**CHAPTER** 

ONE

#### PYDKB PACKAGE

Common library for Data Knowledge Base Dataflow stages development.

Dataflow ETL process (extract-transform-load) for populating internal DKB storages and keeping them up to date

Dataflow stage Logical step of ETL process, implemented as standalone executable program (worker)

Dataflow stages are standalone programs, but can be combined into a pipeline by means of Kafka-based supervising program. For details about program compatibility with the supervisor please check documentation for the Metadata Integration Topology Management System (MInT MS) workers<sup>1</sup>. Worker program can be written in any language; pyDKB is intended to simplify this process for Python.

**Warning:** There are three types of stages corresponding three types of ETL operations: *source connector* (data extraction), *processor* (transformation) and *sink connector* (load to internal DKB storage). Currently pyDKB library can be used only for *processor* stages, but in future versions *connector* stages will also be supported.

### 1.1 Quickstart guide

To create simple processor stage application first decide input and output data format. In following examples we will work with data in JSON format (for the full list of supported formats check pyDKB.dataflow.messages section of this documentation).

Now let's start writing example processor welcome.py and implement message handler – functional part of the stage (operations to be performed on data flow units):

```
from pyDKB.dataflow.messages import JSONMessage

def my_process(stage, message):
    """ Single message processing. """
    input_data = message.content()
    name = input_data.get('name')
    if name:
        out_data = {'message': "Welcome, %s!" % name}
        out_message = JSONMessage(out_data)
        stage.output(out_message)
    return True
```

Function must take two arguments: stage (stage context object) and message (input message, which should be transformed by our stage). Message is a smallest data unit in the data flow running through the processor, and every message is to be processed independently of previous or following ones. message.content() and

<sup>1</sup> WIP

JSONMessage (out\_data) statements are used to decode/encode message to/from Python dict object. Message, passed to the function, is taken from the input data flow; to write new message(s) to the output data flow, stage.output (out\_message) is used. It can be used as many times as many output messages were generated (or once with the list of messages). In our example, messages without key 'name' will produce no output messages, so stage.output() will not be called at all. In terms of data flow it means that the input message is filtered out and will not reach the *sink connector*.

Boolean return value of my\_process() indicates if the processing was successful or not. If processing failed (False is returned), produced output messages will be dropped to avoid loading sketchy information into the DKB storages.

Now as we have processing logic implemented, we need to turn it into fully functional application. Add following lines to welcome.py:

First we create stage object and indicate that input and output message format is JSON: stage = JSONProcessorStage() (for full list of processors check *pyDKB.dataflow.stage package* section of this documentation); then set stage processing function to our function my\_process(), parse command line arguments (stage.parse\_args(sys.argv[1:])) and start the stage execution.

Easy, right?

It's time to run our application. Create input data sample input.ndjson with following lines:

```
{"name": "James", "city": "New York"}
{"user": "Jonathan", "role": "support"}
{"name": "John Smith"}
```

#### and type:

```
$ python welcome.py --dest s input.ndjson
{"message": "Welcome, James!"}
{"message": "Welcome, John Smith!"}
```

--dest s indicates that output destination is (s)tdout (default destination is file). For full information about modes in which the stage application can be used, run python welcome.py -h.

That's it, your first application is ready to be integrated into an ETL process as data processing node. For details about ETL process creation check *MInT Supervisor*<sup>2</sup> documentation.

<sup>&</sup>lt;sup>2</sup> WIP

### 1.2 Subpackages

### 1.2.1 pyDKB.common package

Common modules.

#### **Submodules**

#### pyDKB.common.Type module

Abstract class for type definitions.

#### **Example**

```
class pyDKB.common.Type.Type(*args)
    Bases: object
```

Abstract class for type definitions.

Member names (str) are passed to the constructor as positional arguments.

```
add (name)
```

Add member.

**Parameters** name (str) – name of the member to be added

```
hasMember (val)
```

Check if the member exists (by value).

**Parameters val** (int) – member to be checked

Returns True/False

Return type bool

#### member (name)

Check if the member exists (by name).

**Parameters** name (str) – name to be checked

Returns member value or False if member does not exist

Return type int, bool

#### memberName(val)

Return string name of the member.

**Parameters val** (*int*) – member to retrieve name for

**Returns** member name of False if member does not exist

Return type str, bool

#### pyDKB.common.custom\_readline module

Implementation of "readline"-like functionality for custom separator.

**Todo:** make import of fcntl (or of this module) optional to avoid errors when library is used under Windows.

pyDKB.common.custom\_readline.custom\_readline(f, newline)

Read lines with custom line separator.

Construct generator with readline-like functionality: with every call of next () method it will read data from f untill the newline separator is found; then yields what was read.

Warning: the last line can be incomplete, if the input data flow is interrupted in the middle of data writing.

#### **Parameters**

- **f** (file) readable file object
- **newline** (str) delimeter to be used instead of  $\n$

Returns iterable object

Return type generator

#### **Todo:**

- make last "line" handling more strict: no newline == no line;
- rethink function name (as "line" is actually a "message");
- move functionality to pyDKB.dataflow.communication submodule)

#### pyDKB.common.exceptions module

Definition of common modules exceptions

exception pyDKB.common.exceptions.HDFSException

Bases: exceptions.RuntimeError

Base Exception for HDFS module.

<sup>&</sup>lt;sup>1</sup> https://github.com/PanDAWMS/dkb/pull/129

#### pyDKB.common.hdfs module

```
Utils to interact with HDFS.
pyDKB.common.hdfs.File(fname)
     Get and open temporary local copy of HDFS file
     Return value: open file object (TemporaryFile).
pyDKB.common.hdfs.basename (path)
     Return file name without path.
pyDKB.common.hdfs.check_stderr(proc, timeout=None, max_lines=1)
     Wait till the end of the subprocess and send its STDERR to STDERR.
     Output only MAX LINES of the STDERR to the current STDERR; if MAX LINES == None, output all the
     STDERR.
     Return value is the subprocess' return code.
pyDKB.common.hdfs.dirname (path)
     Return dirname without filename.
pyDKB.common.hdfs.getfile(fname)
     Download file from HDFS.
     Return value: file name (without directory)
pyDKB.common.hdfs.join(path, filename)
     Join path and filename.
pyDKB.common.hdfs.listdir(dirname, mode='a')
     List files and/or subdirectories of HDFS directory.
     Parameters: dirname – directory to list mode – 'a': list all objects
              'f': list files 'd': list subdirectories
pvDKB.common.hdfs.makedirs(dirname)
     Try to create directory (with parents).
pyDKB.common.hdfs.movefile (fname, dest)
     Move local file to HDFS.
pyDKB.common.hdfs.putfile (fname, dest)
     Upload file to HDFS.
pyDKB.common.json utils module
Utils to work with JSON (dict) objects.
pyDKB.common.json_utils.nestedKeys(key)
     Transform STRING with nested keys into LIST.
     Parameters:
          STRING key - dot-separated list of nested keys. If a key contains dot itself, the key must be put be-
              tween quotation marks.
```

1.2. Subpackages 5

Parameters: DICT json\_data - to search in STRING key - dot-separated list of nested keys

pyDKB.common.json\_utils.valueByKey(json\_data, key)

Return value by a chain (list) of nested keys.

#### 1.2.2 pyDKB.dataflow package

Dataflow organization utils.

#### **Subpackages**

#### pyDKB.dataflow.communication package

```
pyDKB.dataflow.communication
pyDKB.dataflow.communication.Message (msg_type)
    Return class XXXMessage, where XXX is the passed type.
```

#### **Subpackages**

#### pyDKB.dataflow.communication.consumer package

```
Consumer submodule init file.
```

```
class pyDKB.dataflow.communication.consumer.ConsumerBuilder(config={})
    Bases: object
    Constructor for Consumer instance.
    build(config={})
        Return constructed consumer.
    consumerClass = None
    setSource(source)
        Set data source for the consumer.
    setType(Type)
        Set message type for the consumer.
```

#### **Submodules**

#### pyDKB.dataflow.communication.consumer.Consumer module

```
pyDKB.dataflow.communication.consumer.Consumer
class pyDKB.dataflow.communication.consumer.Consumer.Consumer(config={})
    Bases: object
    Data consumer implementation.
    close()
        Close opened data stream and data source.
    config = None
    get_message()
        Get new message from current source.
```

**Return values:** Message object False (failed to parse message) None (all input sources are empty)

```
get_source_info()
         Return current source info.
     get_stream()
         Get input stream linked to the current source.
         Return value: InputStream None (no sources left to read from)
     init_stream()
         Init input stream.
     log (message, level=3)
         Output log message with given log level.
     message_class()
         Return message class.
     message_type = None
     next()
         Return new Message, read from input stream.
     reconfigure (config={})
         (Re)initialize consumer with stage config arguments.
     reset_stream()
         Reset input stream to the current source.
     set_message_type (Type)
         Set input message type.
exception pyDKB.dataflow.communication.consumer.Consumer.ConsumerException
     Bases: pyDKB.dataflow.exceptions.DataflowException
     Dataflow Consumer exception.
pyDKB.dataflow.communication.consumer.FileConsumer module
pyDKB.dataflow.communication.consumer.FileConsumer
Data consumer implementation for common (static) files.
TODO: think about:
        · updatable files
        • pipes (better, from the point of StreamConsumer)
        • round-robin (for updatable sources)
class pyDKB.dataflow.communication.consumer.FileConsumer(config={/})
     Bases: pyDKB.dataflow.communication.consumer.Consumer.Consumer
     Data consumer implementation for HDFS data source.
     current_file = None
     get_source()
         Get nearest non-empty source (current or next).
     get_source_info()
         Return current source info.
```

```
init sources()
         Initialize sources iterator if not initialized yet.
     next_source()
         Reset $current_file to the next non-empty file.
         Return value: File descriptor of the new $current file None (no files left)
     reconfigure (config={})
         (Re)initialize consumer with Stage configuration.
     source_is_empty()
         Check if current source is empty.
         Return value: True (empty) False (not empty) None (no source)
pyDKB.dataflow.communication.consumer.HDFSConsumer module
pyDKB.dataflow.communication.consumer.HDFSConsumer
class pyDKB.dataflow.communication.consumer.HDFSConsumer(config={/})
     Bases: pyDKB.dataflow.communication.consumer.FileConsumer.FileConsumer
     Data consumer implementation for HDFS data source.
     reconfigure (config={})
         Configure HDFS Consumer according to the config parameters.
pyDKB.dataflow.communication.consumer.StreamConsumer module
pyDKB.dataflow.communication.consumer.StreamConsumer
Data consumer implementation for a single stream.
TODO: think about multiple streams (like a number of named pipes, etc). Prehaps, even merge this class with
     FileConsumer.
class pyDKB.dataflow.communication.consumer.StreamConsumer.StreamConsumer(config={/})
     Bases: pyDKB.dataflow.communication.consumer.Consumer.Consumer
     Data consumer implementation for Stream data source.
     fd = None
     get_source()
         Get Stream file descriptor.
     get source info()
         Return current source info.
     next source()
         Return None.
         As currenty we believe that there is only one input stream
```

reconfigure (config={})

(Re)configure Stream consumer.

#### pyDKB.dataflow.communication.producer package

Get default directory name.

```
Producer submodule init file.
class pyDKB.dataflow.communication.producer.ProducerBuilder(config={/})
     Bases: object
     Constructor for Producer instance.
     build(config={})
          Return constructed producer.
     message_type = None
     producerClass = None
     setDest (dest)
          Set data destination for the producer.
     \verb"setSourceInfoMethod" (src\_info)
          Set method to get current source info.
     setType (Type)
          Set message type for the producer.
     src_info = None
Submodules
pyDKB.dataflow.communication.producer.FileProducer module
pyDKB.dataflow.communication.producer.FileProducer
Data producer implementation for common (static) files.
TODO: think about:
        • pipes (better, from the point of StreamProducer)

    multiple parallel dests

class pyDKB.dataflow.communication.producer.FileProducer.FileProducer(config={})
     Bases: pyDKB.dataflow.communication.producer.Producer.Producer
     Data producer implementation for local file data dest.
     close()
         Close opened files and remove temporary one.
     close_file()
          Close current file.
     config_dir(config={})
          Configure output directory.
     current_file = None
     default dir()
```

```
dirname (dirname=None)
     Set/get preferable directory name.
ensure_dir()
     Ensure that current directory for output files exists.
file info()
     Return output file metadata (name, directory, ...).
get dest()
     Get destination file descriptor.
get_dest_info()
     Get current destination info.
get_dir()
     Get current directory for output files.
get_filename()
     Return filename, corresponding the source, or timestamp-based.
get source info()
     Set current data source, if any.
reconfigure (config={})
     (Re)configure producer according to the config hash.
reset file()
     Resets current file according to the current source info.
     Metadata include:
           • fd – open file descriptor
           • name – file name
           • dir – directory name
           • local_path – local path to the file
set_default_dir()
     Set default directory name.
subdir(base dir, sub dir=")
     Construct full path for $subdir of $base dir.
```

#### pyDKB.dataflow.communication.producer.HDFSProducer module

pyDKB.dataflow.communication.producer.HDFSProducer

Data producer implementation for common (static) files in HDFS.

#### **TODO: think about:**

- pipes (better, from the point of StreamProducer)
- multiple parallel dests
- ...

class pyDKB.dataflow.communication.producer.HDFSProducer.FileProducer(config={})
 Bases: pyDKB.dataflow.communication.producer.FileProducer

Data producer implementation for HDFS data dest.

```
close file()
          Close current file and move it to HDFS.
     config_dir(config={})
          Configure output directory.
     ensure dir()
          Ensure that current directory for output files exists.
     file info()
          Return output file metadata (name, directory, ...).
     set_default_dir()
          Set default directory name.
     subdir (base_dir, sub_dir=")
          Construct full path for $sub_dir of $base_dir.
pyDKB.dataflow.communication.producer.Producer module
pyDKB.dataflow.communication.producer.Producer
class pyDKB.dataflow.communication.producer.Producer.Producer(config={/})
     Bases: object
     Data producer implementation.
     close()
          Close opened data stream and data dest.
     config = None
     drop()
          Drop buffered messages.
     eop()
          Write EOP marker to the current dest.
     flush()
          Flush buffered messages to the current dest.
     get dest()
          Return current destination.
     get dest info()
          Return current dest info.
     get stream(actualize=True)
          Get output stream linked to the current dest.
          If $actualize parameter set to True, will try to reset current stream destination; else will use last known
          destination or None.
     init_stream()
          Init output stream (without real destination).
     log (message, level=3)
          Output log message with given log level.
     message_class()
          Return message class.
     message_type = None
```

```
reconfigure (config={})
         (Re)initialize producer with stage config arguments.
     reset_stream()
         Reset input stream to the current dest.
     set_message_type (Type)
         Set input message type.
     write (msg)
         Put new message to the current dest (buffer).
exception pyDKB.dataflow.communication.producer.Producer.ProducerException
     Bases: pyDKB.dataflow.exceptions.DataflowException
     Dataflow Producer exception.
pyDKB.dataflow.communication.producer.StreamProducer module
pyDKB.dataflow.communication.producer.StreamProducer
Data producer implementation for a single stream.
TODO: think about multiple streams (like a number of named pipes, etc). Prehaps, even merge this class with
     FileProducer.
class pyDKB.dataflow.communication.producer.StreamProducer.StreamProducer(config={/})
     Bases: pyDKB.dataflow.communication.producer.Producer.Producer
     Data producer implementation for Stream data dest.
     fd = None
     get dest()
         Get Stream file descriptor.
     get_dest_info()
         Return current dest info.
     reconfigure (config={})
         (Re)configure Stream producer.
pyDKB.dataflow.communication.stream package
pyDKB.dataflow.communication.stream
class pyDKB.dataflow.communication.stream.StreamBuilder(fd, config={})
     Bases: object
     Constructor for Stream object.
     build(config={})
         Create instance of Stream.
     message_type = None
     setStream(stream)
         Set stream type: 'input' or 'output'.
     setType (Type)
         Set message type for the Stream.
```

```
streamClass = None
class pyDKB.dataflow.communication.stream.Stream(fd=None, config={})
     Bases: object
     Abstract class for input/output streams.
     close()
          Close open file descriptors etc.
     configure (config)
          Stream configuration.
     get_fd()
          Return open file descriptor or raise exception.
     log(message, level=3)
          Output log message with given log level.
     message_type()
          Get type of the messages in the stream.
     reset (fd, close=True)
          Reset file descriptor in operation.
              Parameters fd – open file descriptor TODO: IOBase objects
     set_message_type (msg_type)
          Set type of the messages in the stream.
class pyDKB.dataflow.communication.stream.InputStream(fd=None, config={})
     Bases: pyDKB.dataflow.communication.stream.Stream.Stream
     Implementation of the input stream.
     get message()
          Get next message from the input stream.
          Return values: Message object False (failed to parse message) None (no messages left)
     next()
          Get next message from the input stream.
     parse_message (message)
          Verify and parse input message.
          Retrun value: Message object False (failed to parse)
     reset (fd, close=True)
          Reset current stream with new file descriptor.
          Overrides parent method to reset __iterator property.
class pyDKB.dataflow.communication.stream.OutputStream(fd=None, config={})
     Bases: pyDKB.dataflow.communication.stream.Stream.Stream
     Implementation of the output stream.
     configure (config={})
          Configure instance.
     drop()
          Drop buffer without sending messages anywhere.
     eop()
          Signalize Supervisor about end of process.
```

```
flush()
          Flush buffer to the output stream.
     msg_buffer = []
     write (message)
          Add message to the buffer.
Submodules
pyDKB.dataflow.communication.stream.InputStream module
pyDKB.dataflow.communication.stream.InputStream
class pyDKB.dataflow.communication.stream.InputStream.InputStream (fd=None,
                                                                                    config=\{\})
     Bases: pyDKB.dataflow.communication.stream.Stream.Stream
     Implementation of the input stream.
     get_message()
          Get next message from the input stream.
          Return values: Message object False (failed to parse message) None (no messages left)
     next()
          Get next message from the input stream.
     parse_message (message)
          Verify and parse input message.
          Retrun value: Message object False (failed to parse)
     reset (fd, close=True)
          Reset current stream with new file descriptor.
          Overrides parent method to reset __iterator property.
pyDKB.dataflow.communication.stream.OutputStream module
pyDKB.dataflow.communication.stream.OutputStream
class pyDKB.dataflow.communication.stream.OutputStream.OutputStream(fd=None,
                                                                                       con-
                                                                                       fig=\{\}
     Bases: pyDKB.dataflow.communication.stream.Stream.Stream
     Implementation of the output stream.
     configure (config={})
          Configure instance.
     drop()
          Drop buffer without sending messages anywhere.
          Signalize Supervisor about end of process.
     flush()
          Flush buffer to the output stream.
```

```
write (message)
         Add message to the buffer.
pyDKB.dataflow.communication.stream.Stream module
pyDKB.dataflow.commuication.stream.Stream
class pyDKB.dataflow.communication.stream.Stream(fd=None, config={})
     Bases: object
     Abstract class for input/output streams.
     close()
         Close open file descriptors etc.
     configure (config)
         Stream configuration.
     get_fd()
         Return open file descriptor or raise exception.
     log (message, level=3)
         Output log message with given log level.
     message_type()
         Get type of the messages in the stream.
     reset (fd, close=True)
         Reset file descriptor in operation.
             Parameters fd – open file descriptor TODO: IOBase objects
     set_message_type (msg_type)
         Set type of the messages in the stream.
pyDKB.dataflow.communication.stream.exceptions module
pyDKB.dataflow.communication.stream.exceptions
exception pyDKB.dataflow.communication.stream.exceptions.StreamException
     Bases: pyDKB.dataflow.exceptions.DataflowException
     Exception for Stream operations.
Submodules
pyDKB.dataflow.communication.messages module
pyDKB.dataflow.communication.messages
Definition of abstract message class and specific message classes
class pyDKB.dataflow.communication.messages.AbstractMessage(message=None)
     Bases: object
     Abstract message
```

msg\_buffer = []

```
content()
         Return message content.
    decode (code)
         Decode original from CODE to TYPE-specific format.
         Raises ValueError
    decoded = None
    encode (code)
         Encode original message from TYPE-specific format to CODE.
         Raises ValueError
    encoded = None
    classmethod extension()
         Return file extension corresponding this message type.
    getOriginal()
         Return original message.
    msg_type = None
    native_types = []
    classmethod typeName()
         Return message type name as string.
exception pyDKB.dataflow.communication.messages.DecodeUnknownType (code, cls)
    Bases: exceptions.NotImplementedError
    Exception to be thrown when message type is not decodable.
exception pyDKB.dataflow.communication.messages.EncodeUnknownType (code, cls)
    Bases: exceptions.NotImplementedError
    Exception to be thrown when message type is not encodable.
class pyDKB.dataflow.communication.messages.JSONMessage(message=None)
    Bases: pyDKB.dataflow.communication.messages.AbstractMessage
    Message in JSON format.
    decode(code=1)
         Decode original data as JSON.
    encode(code=1)
         Encode JSON as CODE.
    msg\_type = 2
    native_types = [<type 'dict'>]
pyDKB.dataflow.communication.messages.Message(msg_type)
    Return class XXXMessage, where XXX is the passed type.
class pyDKB.dataflow.communication.messages.TTLMessage(message=None)
    Bases: pyDKB.dataflow.communication.messages.AbstractMessage
    Messages in TTL format
    Single message = single TTL statement
```

```
decode(code=1)
          Decode original data as TTL.
          Currently takes text as it is. TODO: check some formal matter to confirm the string is TTL.
     encode(code=1)
          Encode TTL as CODE.
     msg\_type = 3
     native_types = [<type 'str'>, <type 'unicode'>]
pyDKB.dataflow.stage package
Stage submodule init file.
class pyDKB.dataflow.stage.ProcessorStage (description='DKB Dataflow data processing
                                                        stage.')
     Bases: pyDKB.dataflow.stage.AbstractStage.AbstractStage
     Abstract class to implement Processor stages
     Processor stage – is a stage for data processing/transfornation.
     Class/instance variable description:
        • communication.consumer.Consumer instance __input
        • Generator object for output file descriptor OR file descriptor (for (s)tream mode)
              __output
        • List of objects to be "stopped" __stoppable
     clear_buffer()
          Drop buffered output messages.
     configure (args=None)
          Configure stage according to the config parameters.
          If $args specified, arguments will be parsed anew.
     defaultArguments()
          Default parser configuration.
     flush buffer()
          Flush message buffer to the output.
     forward()
          Send EOPMarker to the output stream.
     get_out_stream()
          Get current output stream.
     get_source_info()
          Get information about current source.
     input()
          Generator for input messages.
          Returns iterable object. Every iteration returns single input message to be processed.
     input_message_class()
          Get input message class.
```

```
output (message)
          Put the (list of) message(s) to the output buffer.
     output_message_class()
          Get output message class.
     static process(stage, input message)
          Transform input message -> output message.
          To be implemented individually for every stage. Takes the stage as first argument to allow calling output()
              from inside the function.
          Return value: True – processing successfully finished False – processing failed (skip the input message)
     run()
          Run process() for every input() message.
     set_input_message_type(Type=None)
          Set input message type.
     set_output_message_type (Type=None)
          Set output message class.
     stop()
          Finalize all the processes and prepare to exit.
Submodules
pyDKB.dataflow.stage.AbstractStage module
Definition of an abstract class for Dataflow Stages.
class pyDKB.dataflow.stage.AbstractStage.AbstractStage (description='DKB Dataflow
     Bases: object
     Class/instance variable description: * Argument parser (argparse.ArgumentParser)
          parser
        • Parsed arguments (argparse.Namespace) ARGS
        • Stage config parser (ConfigParser.SafeConfigParser) config

    Stage custom config (defaultdict(defaultdict(str))) CONFIG

     add_argument (*args, **kwargs)
          Add specific (not common) arguments.
     args_error (message)
          Output USAGE, error message and exit with code 2.
     config_error (message='Failed to read config file:')
          Output error message and exit with code 3.
     defaultArguments()
          Config argument parser with parameters common for all stages.
     log(message, level=3)
          Output log message with given log level.
```

```
output_error (message=None, exc_info=None)
     Output traceback of the passed (or last) error with message.
parse_args (args)
     Parse arguments and set dependant arguments if needed.
     Exits in case of error with code: 2 – failed to parse arguments 3 – failed to read config file
print_usage (fd=<open file '<stderr>', mode 'w'>)
     Print usage message.
read_config()
     Reads stage custom config file.
         Returns (TruelFalse)
run()
     Run the stage.
set_error (err_type, err_val, err_trace)
     Set object _err variable from the last error info.
stop()
     Stop running processes and output error information.
```

#### pyDKB.dataflow.stage.ProcessorStage module

Definition of an abstract class for Dataflow Data Processing Stages.

**USAGE:** ProcessorStage [<options>] [<input files>]

#### **OPTIONS:**

```
-s, --source
                      {flslh} - where to get data from: local (f)iles, (s)tdin, (h)dfs
-i, --input-dir
                      DIR - base directory for relative input file names (for local and
                      HDFS sources). If <input files> not specified, all files from the
                      directory will be taken as the input.
-d, --dest
                      {flslh} - where to send data to: local (f)iles, (s)tdout, (h)dfs
-o, --output-dir
                      DIR - base directory for output files (for local and HDFS
                      sources)
--hdfs
                        • equivalent to "-source h -dest h"
                      MODE - MODE: (f)ile = -source f
-m, --mode
                           -dest f (can be
                             rewritten with 's' or 'h')
                      (s)tream = -source s (can be
                             rewritten with 'h')
                           -dest s
                      (m)apreduce = -source s (can be
                             rewritten with 'h')
                           -dest s
```

```
class pyDKB.dataflow.stage.ProcessorStage.ProcessorStage(description='DKB
                                                                             Dataflow data processing
                                                                             stage.')
     Bases: pyDKB.dataflow.stage.AbstractStage.AbstractStage
     Abstract class to implement Processor stages
     Processor stage – is a stage for data processing/transfornation.

          Transform input_message -> output_message.
          To be implemented individually for every stage. Takes the stage as first argument to allow calling output()
```

**Return value:** True – processing successfully finished False – processing failed (skip the input message)

from inside the function.

```
run ()
    Run process() for every input() message.
set_input_message_type (Type=None)
    Set input message type.
set_output_message_type (Type=None)
    Set output message class.
stop ()
    Finalize all the processes and prepare to exit.
```

#### **Submodules**

#### pyDKB.dataflow.cds module

Extended CDSInvenioConnector allowing us to login via Kerberos

#### pyDKB.dataflow.dkbID module

Utils to generate unique yet meaningful identifier for DKB objects.

```
pyDKB.dataflow.dkbID.dkbID (json_data, data_type)
Return unique identifier for object of TYPE based on DATA.
```

#### pyDKB.dataflow.exceptions module

Definition of DKB Dataflow exceptions

```
\begin{tabular}{ll} \textbf{exception} & \textbf{pyDKB.dataflow.exceptions.DataflowException} \\ \textbf{Bases:} & \textbf{exceptions.Exception} \\ \end{tabular}
```

Base Exception for Dataflow modules.

#### pyDKB.dataflow.types module

Type definitions for library objects.
