ONE

## PYDKB PACKAGE

Common library for Data Knowledge Base Dataflow stages development.

Dataflow ETL process (extract-transform-load) for populating internal DKB storages and keeping them up to date

Dataflow stage Logical step of ETL process, implemented as standalone executable program (worker)

Dataflow stages are standalone programs, but can be combined into a pipeline by means of Kafka-based supervising program. For details about program compatibility with the supervisor please check documentation for the Metadata Integration Topology Management System (MInT MS) workers<sup>1</sup>. Worker program can be written in any language; pyDKB is intended to simplify this process for Python.

**Warning:** There are three types of stages corresponding three types of ETL operations: *source connector* (data extraction), *processor* (transformation) and *sink connector* (load to internal DKB storage). Currently pyDKB library can be used only for *processor* stages, but in future versions *connector* stages will also be supported.

## 1.1 Quickstart guide

To create simple processor stage application first decide input and output data format. In following examples we will work with data in JSON format (for the full list of supported formats check *pyDKB.dataflow.communication.messages module* section of this documentation).

Now let's start writing example processor welcome.py and implement message handler – functional part of the stage (operations to be performed on data flow units):

```
from pyDKB.dataflow.communication.messages import JSONMessage

def my_process(stage, message):
    """ Single message processing. """
    input_data = message.content()
    name = input_data.get('name')
    if name:
        out_data = {'message': "Welcome, %s!" % name}
        out_message = JSONMessage(out_data)
        stage.output(out_message)
    return True
```

Function must take two arguments: stage (stage context object) and message (input message, which should be transformed by our stage). Message is a smallest data unit in the data flow running through the processor, and every message is to be processed independently of previous or following ones. message.content() and

<sup>1</sup> WIP

JSONMessage (out\_data) statements are used to decode/encode message to/from Python dict object. Message, passed to the function, is taken from the input data flow; to write new message(s) to the output data flow, stage.output(out\_message) is used. It can be used as many times as many output messages were generated (or once with the list of messages). In our example, messages without key 'name' will produce no output messages, so stage.output() will not be called at all. In terms of data flow it means that the input message is filtered out and will not reach the *sink connector*.

Boolean return value of my\_process() indicates if the processing was successful or not. If processing failed (False is returned), produced output messages will be dropped to avoid loading sketchy information into the DKB storages.

Now as we have processing logic implemented, we need to turn it into fully functional application. Add following lines to welcome.py:

First we create stage object: stage = JSONProcessorStage(); then indicate that input and output message format is JSON: stage.set\_{input,output}\_message\_type (messageType.JSON) (for full list of message types check pyDKB.dataflow.communication.messages module section of this documentation); then set stage processing function to our function my\_process(), parse command line arguments and configure stage instance according to it (stage.configure(sys.argv[1:])). Now we ready to start the stage execution.

Easy, right?

It's time to run our application. Create input data sample input.ndjson with following lines:

```
{"name": "James", "city": "New York"}
{"user": "Jonathan", "role": "support"}
{"name": "John Smith"}
```

and type:

```
$ python welcome.py --dest s input.ndjson
{"message": "Welcome, James!"}
{"message": "Welcome, John Smith!"}
```

--dest s indicates that output destination is (s)tdout (default destination is file). For full information about modes in which the stage application can be used, run python welcome.py -h.

That's it, your first application is ready to be integrated into an ETL process as data processing node. For details about ETL process creation check *MInT Supervisor*<sup>2</sup> documentation.

 $<sup>^{2}</sup>$  WIP

## 1.2 Subpackages

## 1.2.1 pyDKB.atlas package

Functionality required only for ATLAS metadata processing.

#### **Submodules**

## pyDKB.atlas.misc module

Miscellaneous functions required to operate with ATLAS metadata objects.

```
pyDKB.atlas.misc.dataset_data_format(datasetname)
```

Extract data format from dataset name.

According to dataset naming nomenclature: https://dune.bnl.gov/w/images/9/9e/Gen-int-2007-001\_%28NOMENCLATURE%29.pdf for MC datasets:

mcNN\_subProject.datasetNumber.physicsShort.prodStep.dataType.Version

for Real Data: DataNN\_subProject.runNumber.streamName.prodStep.dataType.Version

In both cases the dataType field is required.

**Parameters** datasetname (str) – dataset name

**Returns** data format, None if *datasetname* is None, empty string, etc.

Return type str

```
pyDKB.atlas.misc.dataset scope (dsn)
```

Extract the first field from the dataset name

Example: mc15\_13TeV.XXX mc15\_13TeV:YYY.XXX

**Parameters** dsn(str) – full dataset name

Returns dataset scope

**Return type** str

```
pyDKB.atlas.misc.normalize_dataset_name (dsn)
```

Remove an explicitly stated scope from a dataset name.

According to dataset nomenclature, dataset name cannot include a ':' symbol. If a dataset name is in 'A:B' format, then A, probably, is an explicitly stated scope that should be removed.

Parameters dsn (str) - dataset name

Returns dataset name without explicit scope, unchanged dataset name if it was already normal

Return type str

## 1.2.2 pyDKB.common package

Common modules.

#### **Submodules**

#### pyDKB.common.LoggableObject module

```
pyDKB.common.LoggableObject
class pyDKB.common.LoggableObject.LoggableObject
Bases: object
    Common ancestor for all classes that need 'log' method.
    classmethod log(message, level=3)
        Output log message with given log level.
```

## **Parameters**

- message(str) message to output
- level (pyDKB.common.types.logLevel member) log level of the message

#### pyDKB.common.Type module

Abstract class for type definitions.

#### **Example**

```
>>> myType = Type("Orange", "Apple")
>>> myType.add("Plum")
>>> t = myType.Orange
>>> if t == myType.Orange:
...    print "Orange!"
... elif t == myType.member("Apple"):
...    print "Apple!"
...
Orange!
>>> if not myType.member("Walnut"):
...    print "Wrong type!"
...
Wrong type!
```

```
class pyDKB.common.Type.Type(*args)
Bases: object
Abstract class for type definitions.
Member names (str) are passed to the constructor as positional arguments.
add (name)
Add member.

Parameters name(str) - name of the member to be added
hasMember(val)
Check if the member exists (by value).

Parameters val(int) - member to be checked
Returns True/False
Return type bool
```

#### member (name)

Check if the member exists (by name).

**Parameters** name (str) – name to be checked

Returns member value or False if member does not exist

**Return type** int, bool

#### memberName(val)

Return string name of the member.

**Parameters val** (*int*) – member to retrieve name for

Returns member name of False if member does not exist

Return type str, bool

## pyDKB.common.custom\_readline module

Implementation of "readline"-like functionality for custom separator.

Todo: make import of fcntl (or of this module) optional to avoid errors when library is used under Windows.

```
pyDKB.common.custom_readline.custom_readline(f, newline)
```

Read lines with custom line separator.

Construct generator with readline-like functionality: with every call of next () method it will read data from f untill the newline separator is found; then yields what was read.

Warning: the last line can be incomplete, if the input data flow is interrupted in the middle of data writing.

To check if iteration is not over without reading next value, one may *send(True)* to the generator: it will return *True* if there is another message to yield or raise *StopIteration* if nothing left.

#### **Parameters**

- **f** (file) readable file object
- **newline** (str) delimeter to be used instead of  $\n$

Returns iterable object

Return type generator

#### **Todo:**

- make last "line" handling more strict: no newline == no line;
- rethink function name (as "line" is actually a "message");
- move functionality to pyDKB.dataflow.communication submodule)

<sup>&</sup>lt;sup>1</sup> https://github.com/PanDAWMS/dkb/pull/129

### pyDKB.common.exceptions module

```
Definition of common modules exceptions
```

```
exception pyDKB.common.exceptions.HDFSException
Bases: exceptions.RuntimeError
```

Base Exception for HDFS module.

## pyDKB.common.hdfs module

```
Utils to interact with HDFS.
pyDKB.common.hdfs.File (fname)
     Get and open temporary local copy of HDFS file
     Return value: open file object (TemporaryFile).
pyDKB.common.hdfs.basename(p)
     Return file name without path.
pyDKB.common.hdfs.check_stderr(proc, timeout=None, max_lines=1)
     Wait till the end of the subprocess and send its STDERR to STDERR.
     Output only MAX_LINES of the STDERR to the current STDERR; if MAX_LINES == None, output all the
     STDERR.
     Return value is the subprocess' return code.
pyDKB.common.hdfs.dirname(p)
     Return dirname without filename.
pyDKB.common.hdfs.getfile(fname)
     Download file from HDFS.
     Return value: file name (without directory)
pyDKB.common.hdfs.join(p, *args)
     Join given paths.
pyDKB.common.hdfs.listdir(dirname, mode='a')
     List files and/or subdirectories of HDFS directory.
     Parameters: dirname – directory to list mode – 'a': list all objects
              'f': list files 'd': list subdirectories
pyDKB.common.hdfs.makedirs(dirname)
     Try to create directory (with parents).
pyDKB.common.hdfs.movefile (fname, dest)
     Move local file to HDFS.
pyDKB.common.hdfs.putfile(fname, dest)
     Upload file to HDFS.
```

#### pyDKB.common.json\_utils module

Utils to work with JSON (dict) objects.

```
pyDKB.common.json_utils.nestedKeys(key)
```

Transform STRING with nested keys into LIST.

#### **Parameters:**

**STRING key – dot-separated list of nested keys.** If a key contains dot itself, the key must be put between quotation marks.

```
pyDKB.common.json_utils.valueByKey(json_data, key)
```

Return value by a chain (list) of nested keys.

Parameters: DICT json\_data - to search in STRING key - dot-separated list of nested keys

#### pyDKB.common.misc module

pyDKB.common.misc

Miscellanious utility functions.

```
pyDKB.common.misc.ensure_argparse_arg_name (args, kwargs)
```

Ensure cmgline argument name for argparse.add\_argument().

Returns the expected argument name and updates kwargs['dest'] value.

When :python:func:'argparse.add\_argument()' is called, argparse decides how to name the new argument basing on the passed parameters (to use this name in argparse.Namespace object). This function returns the name, that (supposedly) will be used in argparse; but to make sure, kwargs['dest'] is (re)set to the same value (if applicable).

For parameters description please refer to *argparse* documentation: https://docs.python.org/2.7/library/argparse. html#the-add-argument-method

## **Parameters**

- args (list) list of argparse.add\_argument() positional parameters
- **kwargs** (dict) hash of argparse.add\_argument() keyword parameters

Returns argument name

**Return type** string

```
pyDKB.common.misc.execute_with_retry(f, args=[], kwargs={}, retry_on=(<type 'exceptions.Exception'>, ), max_tries=3, sleep=5)
```

Try to call function f and retry in case of error.

#### **Parameters**

- f (callable) function to call
- args (list) positional arguments
- **kwargs** (dict) keyword arguments
- retry\_on (set) which exceptions should be retried
- max\_tries (int) max number of retries
- **sleep** (*int*) pause between retries (sec)

**Returns** f execution result

Return type object

```
pyDKB.common.misc.log (message, level=3, *args)
Output log message with given log level.
```

In case of multiline messages or list of messages only first line (message) is prepended with provided prefixes and timestamp; in all the next lines (messages) they are replaced with special prefix '(==)', representing that these lines belong to the same log record.

Empty lines and lines containing only whitespace symbols are ignored.

#### **Parameters**

- message (object) message to output (string, list of strings or any other object)
- level (pyDKB.common.types.logLevel member) log level of the message
- \*args additional prefixes (will be output between log level prefix and message body)

#### pyDKB.common.types module

```
pyDKB.common.types
```

Definitions of types used across all the library modules.

## 1.2.3 pyDKB.dataflow package

Dataflow organization utils.

#### **Subpackages**

#### pyDKB.dataflow.communication package

```
pyDKB.dataflow.communication
```

```
pyDKB.dataflow.communication.Message (msg_type)
Return class XXXMessage, where XXX is the passed type.
```

## **Subpackages**

#### pyDKB.dataflow.communication.consumer package

```
Consumer submodule init file.
```

```
class pyDKB.dataflow.communication.consumer.ConsumerBuilder (config={})
    Bases: object
    Constructor for Consumer instance.
    build(config={})
        Return constructed consumer.
    consumerClass = None
    setSource(source)
        Set data source for the consumer.
    setType(Type)
        Set message type for the consumer.
```

#### **Submodules**

## pyDKB.dataflow.communication.consumer.Consumer module

```
pyDKB.dataflow.communication.consumer.Consumer
class pyDKB.dataflow.communication.consumer.Consumer.Consumer(config={/})
     Bases: pyDKB.common.LoggableObject.LoggableObject
     Data consumer implementation.
     close()
          Close opened data stream and data source.
     config = None
     get_item()
          Get next processing item (constructed of raw items).
          Processing item is the smallest data unit for stage processing loop (e.g. ProcessorStage).
              Returns parsed next item, False – parsing failed, None – no messages left
              Return type pyDKB.dataflow.communication.messages.AbstractMessage, bool, NoneType
     get_raw_item()
          Get new raw (stream) item from current source.
          Raw (stream) item is an object representing some of the supervisor/worker communication protocol ob-
          Return values: Message object False (failed to parse message) None (all input sources are empty)
     get_source_info()
          Return current source info.
     get_stream()
          Get input stream linked to the current source.
          Return value: InputStream None (no sources left to read from)
     init_stream()
          Init input stream.
     message_class()
          Return message class.
     message_type = None
     next()
          Get next processing item (Message) from current source.
     reconfigure (config={})
          (Re)initialize consumer with stage config arguments.
     reset stream()
          Reset input stream to the current source.
     set_message_type(Type)
          Set input message type.
     stream_is_readable()
          Check if input data stream is readable.
```

```
Returns True – stream is initialized and not empty, False – stream is empty, None – stream is not initialized
```

Return type bool, NoneType

```
exception pyDKB.dataflow.communication.consumer.Consumer.ConsumerException (message=", reason=None)
```

 $\textbf{Bases:} \ \textit{pyDKB.dataflow.exceptions.DataflowException}$ 

Dataflow Consumer exception.

## pyDKB.dataflow.communication.consumer.FileConsumer module

pyDKB.dataflow.communication.consumer.FileConsumer

Data consumer implementation for common (static) files.

#### **TODO:** think about:

- · updatable files
- pipes (better, from the point of StreamConsumer)
- round-robin (for updatable sources)
- . . .

```
class pyDKB.dataflow.communication.consumer.FileConsumer.FileConsumer(config={})
    Bases: pyDKB.dataflow.communication.consumer.Consumer
```

Data consumer implementation for HDFS data source.

```
current_file = None
get_source()
    Get nearest non-empty source (current or next).
```

get\_source\_info()
Return current source info.

```
init_sources()
```

Initialize sources iterator if not initialized yet.

```
next_source()
```

Reset \$current\_file to the next non-empty file.

**Return value:** File descriptor of the new \$current\_file None (no files left)

```
reconfigure (config={})
```

(Re)initialize consumer with Stage configuration.

```
source_is_readable()
```

Check if current source is readable.

**Returns** None – no source, False – source is empty / fully read, True – source is defined and is not empty

Return type bool, NoneType

### pyDKB.dataflow.communication.consumer.HDFSConsumer module

```
pyDKB.dataflow.communication.consumer.HDFSConsumer
class pyDKB.dataflow.communication.consumer.HDFSConsumer.HDFSConsumer(config={})
    Bases: pyDKB.dataflow.communication.consumer.FileConsumer.FileConsumer
    Data consumer implementation for HDFS data source.
    reconfigure(config={})
        Configure HDFS Consumer according to the config parameters.
```

## pyDKB.dataflow.communication.consumer.StreamConsumer module

pyDKB.dataflow.communication.consumer.StreamConsumer

Data consumer implementation for a single stream.

**TODO:** think about multiple streams (like a number of named pipes, etc). Prehaps, even merge this class with FileConsumer.

```
class pyDKB.dataflow.communication.consumer.StreamConsumer.Consumer(config={})
    Bases: pyDKB.dataflow.communication.consumer.Consumer
```

Data consumer implementation for Stream data source.

```
fd = None
get_source()
    Get Stream file descriptor.
get_source_info()
    Return current source info.
next_source()
    Return None.
    As currenty we believe that there is only one input stream
reconfigure(config={})
    (Re)configure Stream consumer.
```

### pyDKB.dataflow.communication.producer package

Producer submodule init file.

```
class pyDKB.dataflow.communication.producer.ProducerBuilder(config={})
    Bases: object
    Constructor for Producer instance.
    build(config={})
        Return constructed producer.

message_type = None
    producerClass = None
    setDest(dest)
        Set data destination for the producer.
```

```
setSourceInfoMethod(src_info)
          Set method to get current source info.
     setType(Type)
          Set message type for the producer.
     src info = None
Submodules
pyDKB.dataflow.communication.producer.FileProducer module
pyDKB.dataflow.communication.producer.FileProducer
Data producer implementation for common (static) files.
TODO: think about:
        • pipes (better, from the point of StreamProducer)
        • multiple parallel dests
class pyDKB.dataflow.communication.producer.FileProducer.FileProducer(config={/})
     Bases: pyDKB.dataflow.communication.producer.Producer.Producer
     Data producer implementation for local file data dest.
     close()
          Close opened files and remove temporary one.
     close file()
          Close current file.
     config_dir(config={})
          Configure output directory.
     current_file = None
     default_dir()
          Get default directory name.
     dirname (dirname=None)
          Set/get preferable directory name.
     ensure dir()
          Ensure that current directory for output files exists.
     file info()
          Return output file metadata (name, directory, ...).
     get_dest()
          Get destination file descriptor.
```

get\_dest\_info()

get\_filename()

get\_dir()

Get current destination info.

Get current directory for output files.

Return filename, corresponding the source, or timestamp-based.

```
get_source_info()
          Set current data source, if any.
     reconfigure (config={})
          (Re)configure producer according to the config hash.
     reset file()
          Resets current file according to the current source info.
          Metadata include:
                • fd – open file descriptor
                • name – file name
                • dir – directory name
                • local_path – local path to the file
     set_default_dir()
          Set default directory name.
     subdir(base dir, sub dir=")
          Construct full path for $subdir of $base_dir.
pyDKB.dataflow.communication.producer.HDFSProducer module
pyDKB.dataflow.communication.producer.HDFSProducer
Data producer implementation for common (static) files in HDFS.
TODO: think about:
        • pipes (better, from the point of StreamProducer)
        • multiple parallel dests
class pyDKB.dataflow.communication.producer.HDFSProducer(config={})
     Bases: pyDKB.dataflow.communication.producer.FileProducer.FileProducer
     Data producer implementation for HDFS data dest.
     close file()
          Close current file and move it to HDFS.
     config_dir(config={})
          Configure output directory.
     ensure dir()
          Ensure that current directory for output files exists.
     file_info()
          Return output file metadata (name, directory, ...).
     set_default_dir()
          Set default directory name.
     subdir (base_dir, sub_dir=")
          Construct full path for $sub_dir of $base_dir.
```

### pyDKB.dataflow.communication.producer.Producer module

```
pyDKB.dataflow.communication.producer.Producer
class pyDKB.dataflow.communication.producer.Producer.Producer(config={})
     Bases: pyDKB.common.LoggableObject.LoggableObject
     Data producer implementation.
     close()
          Close opened data stream and data dest.
     config = None
     drop()
          Drop buffered messages.
          Write EOP marker to the current dest.
     flush()
          Flush buffered messages to the current dest.
     get_dest()
          Return current destination.
     get_dest_info()
          Return current dest info.
     get stream(actualize=True)
          Get output stream linked to the current dest.
          If $actualize parameter set to True, will try to reset current stream destination; else will use last known
          destination or None.
     init stream()
          Init output stream (without real destination).
     message_class()
          Return message class.
     message_type = None
     reconfigure (config={})
          (Re)initialize producer with stage config arguments.
     reset_stream()
          Reset input stream to the current dest.
     set_message_type (Type)
          Set input message type.
     write (msg)
          Put new message to the current dest (buffer).
exception pyDKB.dataflow.communication.producer.Producer.ProducerException(message=",
                                                                                                 son=None)
     Bases: pyDKB.dataflow.exceptions.DataflowException
```

Dataflow Producer exception.

### pyDKB.dataflow.communication.producer.StreamProducer module

```
py DKB. data flow. communication. producer. Stream Producer\\
```

Data producer implementation for a single stream.

**TODO:** think about multiple streams (like a number of named pipes, etc). Prehaps, even merge this class with FileProducer.

```
class pyDKB.dataflow.communication.producer.StreamProducer.StreamProducer(config={})
    Bases: pyDKB.dataflow.communication.producer.Producer
```

Data producer implementation for Stream data dest.

```
fd = None
get_dest()
    Get Stream file descriptor.
get_dest_info()
    Return current dest info.
reconfigure(config={})
    (Re)configure Stream producer.
```

#### pyDKB.dataflow.communication.stream package

```
pyDKB.dataflow.communication.stream
```

```
class pyDKB.dataflow.communication.stream.StreamBuilder(fd, config={})
     Bases: object
     Constructor for Stream object.
     build(config={})
          Create instance of Stream.
     message_type = None
     setStream(stream)
          Set stream type: 'input' or 'output'.
     setType (Type)
          Set message type for the Stream.
     streamClass = None
class pyDKB.dataflow.communication.stream.Stream(fd=None, config={})
     Bases: pyDKB.common.LoggableObject.LoggableObject
     Abstract class for input/output streams.
     EOM = None
     close()
          Close open file descriptors etc.
     configure (config)
         Stream configuration.
     get fd()
          Return open file descriptor or raise exception.
```

```
message_type()
          Get type of the messages in the stream.
     reset (fd, close=True)
          Reset file descriptor in operation.
              Parameters fd – open file descriptor TODO: IOBase objects
              Returns previous file descriptor (or None)
     set_message_type (msg_type)
          Set type of the messages in the stream.
class pyDKB.dataflow.communication.stream.InputStream(fd=None, config={})
     Bases: pyDKB.dataflow.communication.stream.Stream.Stream
     Implementation of the input stream.
     get_item()
          Get next stream item (constructed of raw items).
          Stream item is an object representing some of the supervisor/worker communication protocol objects (e.g.
          Message).
              Returns parsed next item, False – parsing failed, None – no messages left
              Return type pyDKB.dataflow.communication.messages.AbstractMessage, bool, NoneType
     get raw item()
          Get next raw item from the input stream.
          Raw item is a sequence of symbols that corresponds to the supervisor/worker communication protocol
          object. Known objects: * message (<raw_data>+<EOM>).
              Returns next raw item
              Return type str
     is readable()
          Check if current input stream is readable.
              Returns None – not initialized, False – empty, True – not empty
              Return type bool, NoneType
     next()
          Get next item (message) from the input stream.
              Raises StopIteration: no items left
              Returns parsed next item, False – parsing failed or unexpected end of stream occurred
              Return type pyDKB.dataflow.communication.messages.AbstractMessage, bool
     parse_message (message)
          Verify and parse input message.
              Parameters message
                                                 (pyDKB.dataflow.communication.messages.
                  AbstractMessage) - message to parse
              Returns decoded message or False if parsing failed
              Return type pyDKB.dataflow.communication.messages.AbstractMessage, bool
     reset (fd, close=True, force=False)
          Reset current stream with new file descriptor.
```

Overrides parent method to reset \_\_iterator property.

#### **Parameters**

- **fd** (file) new file descriptor
- close (bool) if True, close the old file descriptor
- **force** (bool) if True, force the reset of iterator (normally, iterator is not reset if the new file descriptor is the same as the old one)

Returns old file descriptor

```
Return type file
```

```
class pyDKB.dataflow.communication.stream.OutputStream(fd=None, config={})
Bases: pyDKB.dataflow.communication.stream.Stream
Implementation of the output stream.

configure(config={})
    Configure instance.

drop()
    Drop buffer without sending messages anywhere.

eop()
    Signalize Supervisor about end of process.

flush()
    Flush buffer to the output stream.

msg_buffer = []
    write(message)
```

#### **Submodules**

### pyDKB.dataflow.communication.stream.InputStream module

```
pyDKB.dataflow.communication.stream.InputStream
```

Add message to the buffer.

Stream item is an object representing some of the supervisor/worker communication protocol objects (e.g. Message).

**Returns** parsed next item, False – parsing failed, None – no messages left

Return type pyDKB.dataflow.communication.messages.AbstractMessage, bool, NoneType

```
get_raw_item()
```

Get next raw item from the input stream.

Raw item is a sequence of symbols that corresponds to the supervisor/worker communication protocol object. Known objects: \* message (<raw\_data>+<EOM>).

```
Returns next raw item
              Return type str
     is_readable()
          Check if current input stream is readable.
              Returns None – not initialized, False – empty, True – not empty
              Return type bool, NoneType
     next()
          Get next item (message) from the input stream.
              Raises StopIteration: no items left
              Returns parsed next item, False – parsing failed or unexpected end of stream occurred
              Return type pyDKB.dataflow.communication.messages.AbstractMessage, bool
     parse_message (message)
          Verify and parse input message.
              Parameters message
                                                 (pyDKB.dataflow.communication.messages.
                  AbstractMessage) - message to parse
              Returns decoded message or False if parsing failed
              Return type pyDKB.dataflow.communication.messages.AbstractMessage, bool
     reset (fd, close=True, force=False)
          Reset current stream with new file descriptor.
          Overrides parent method to reset __iterator property.
              Parameters
                  • fd (file) – new file descriptor
                  • close (bool) – if True, close the old file descriptor
                  • force (bool) – if True, force the reset of iterator (normally, iterator is not reset if the
                    new file descriptor is the same as the old one)
              Returns old file descriptor
              Return type file
pyDKB.dataflow.communication.stream.OutputStream module
pyDKB.dataflow.communication.stream.OutputStream
class pyDKB.dataflow.communication.stream.OutputStream.OutputStream (fd=None,
                                                                                           con-
                                                                                           fig=\{\}
     Bases: pyDKB.dataflow.communication.stream.Stream.Stream
     Implementation of the output stream.
     configure (config={})
          Configure instance.
     drop()
```

Drop buffer without sending messages anywhere.

```
eop()
          Signalize Supervisor about end of process.
     flush()
         Flush buffer to the output stream.
     msg_buffer = []
     write (message)
          Add message to the buffer.
pyDKB.dataflow.communication.stream.Stream module
py DKB. data flow. commuication. stream. Stream \\
class pyDKB.dataflow.communication.stream.Stream(fd=None, config={})
     Bases: pyDKB.common.LoggableObject.LoggableObject
     Abstract class for input/output streams.
     EOM = None
     close()
         Close open file descriptors etc.
     configure (config)
         Stream configuration.
     get fd()
         Return open file descriptor or raise exception.
     message_type()
         Get type of the messages in the stream.
     reset (fd, close=True)
          Reset file descriptor in operation.
             Parameters fd – open file descriptor TODO: IOBase objects
             Returns previous file descriptor (or None)
     set_message_type (msg_type)
          Set type of the messages in the stream.
pyDKB.dataflow.communication.stream.exceptions module
pyDKB.dataflow.communication.stream.exceptions
exception pyDKB.dataflow.communication.stream.exceptions.StreamException (message=",
                                                                                             son=None)
     Bases: pyDKB.dataflow.exceptions.DataflowException
     Exception for Stream operations.
```

1.2. Subpackages 19

**Submodules** 

### pyDKB.dataflow.communication.messages module

```
pyDKB.dataflow.communication.messages
Definition of abstract message class and specific message classes
class pyDKB.dataflow.communication.messages.AbstractMessage(message=None)
     Bases: object
     Abstract message
     content()
         Return message content.
     decode (code)
         Decode original from CODE to TYPE-specific format.
         Raises ValueError
     decoded = None
     encode (code)
         Encode original message from TYPE-specific format to CODE.
         Raises ValueError
     encoded = None
     classmethod extension()
         Return file extension corresponding to this message type.
     getOriginal()
         Return original message.
     incompl = None
     incomplete(status=None)
         Set message incomplete marker and/or get previous/current value.
             Parameters status (bool, NoneType) – new status (if not passed, current status is re-
                turned)
             Returns incomplete marker status (previous value, if reset)
             Return type bool
     msg_type = None
     native_types = []
     classmethod typeName()
         Return message type name as string.
exception pyDKB.dataflow.communication.messages.DecodeUnknownType (code, cls)
     Bases: exceptions.NotImplementedError
     Exception to be thrown when message type is not decodable.
exception pyDKB.dataflow.communication.messages.EncodeUnknownType (code, cls)
     Bases: exceptions.NotImplementedError
     Exception to be thrown when message type is not encodable.
class pyDKB.dataflow.communication.messages.JSONMessage (message=None)
     Bases: pyDKB.dataflow.communication.messages.AbstractMessage
     Message in JSON format.
```

```
decode(code=1)
         Decode original data as JSON.
     encode(code=1)
         Encode JSON as CODE.
     incompl_key = '_incomplete'
     msg\_type = 2
     native_types = [<type 'dict'>, <type 'list'>, <type 'int'>, <type 'float'>]
pyDKB.dataflow.communication.messages.Message (msg_type)
     Return class XXXMessage, where XXX is the passed type.
class pyDKB.dataflow.communication.messages.TTLMessage(message=None)
     Bases: pyDKB.dataflow.communication.messages.AbstractMessage
     Messages in TTL format
     Single message = single TTL statement
     decode(code=1)
         Decode original data as TTL.
         Currently takes text as it is. TODO: check some formal matter to confirm the string is TTL.
     encode(code=1)
         Encode TTL as CODE.
     msg\_type = 3
     native_types = [<type 'str'>, <type 'unicode'>]
pyDKB.dataflow.stage package
Stage submodule init file.
class pyDKB.dataflow.stage.ProcessorStage (description='DKB Dataflow data processing
                                                     stage.')
     Bases: pyDKB.dataflow.stage.AbstractStage.AbstractStage
     Abstract class to implement Processor stages
     Processor stage – is a stage for data processing/transformation.
     Class/instance variable description:
        • communication.consumer.Consumer instance __input
        • Generator object for output file descriptor OR file descriptor (for (s)tream mode)
             __output
       • List of objects to be "stopped" __stoppable
     clear_buffer()
         Drop buffered output messages.
     configure (args=None)
         Configure stage according to the config parameters.
         If $args specified, arguments will be parsed anew.
     defaultArguments()
         Default parser configuration.
```

## flush buffer() Flush message buffer to the output. forward() Send EOPMarker to the output stream. get source info() Get information about current source. input() Generator for input messages. Returns iterable object. Every iteration returns single input message to be processed. input message class() Get input message class. output (message) Put the (list of) message(s) to the output buffer. output\_message\_class() Get output message class. static process(stage, input message) Transform input\_message -> output\_message. To be implemented individually for every stage. Takes the stage as first argument to allow calling output() from inside the function. **Return value:** True – processing successfully finished False – processing failed (skip the input message) run() Run process() for every input() message. set\_default\_arguments (ignore\_on\_skip=False, \*\*kwargs) Set (or overwrite) default values for arguments. **Parameters** • ignore\_on\_skip (bool) - ignore new default value when the stage is to be skipped • <arg name> (object) - default value for argument <arg name> set\_input\_message\_type (Type=None) Set input message type.

#### set\_output\_message\_type (Type=None)

Set output message class.

#### static skip\_process(stage, input\_message)

Process input\_message in "skip" processing mode.

Skip mode is turned on with command line parameter *–skip*; in this mode stage is expected to skip its "semantic" part of the message transformation (like changes in data fields format, definition of additional data fields, etc.) but perform actions required to keep the dataflow seamless.

The simpliest way to achieve this is to send the input message to the output without changes (marking it as "incomplete"), and this is the default implementation of the method.

In some cases it may be necessary to re-implement it (just like process()) to keep the dataflow unbroken.

NOTE: the output messages in "skip" mode MUST be marked as "incomplete".

```
Parameters input_message (pyDKB.messages.AbstractMessage) - message to
                  process
              Returns True/False (success/failure)
              Return type bool
     stop()
          Finalize all the processes and prepare to exit.
Submodules
pyDKB.dataflow.stage.AbstractStage module
Definition of an abstract class for Dataflow Stages.
class pyDKB.dataflow.stage.AbstractStage.AbstractStage (description='DKB Dataflow
                                                                         stage')
     Bases: pyDKB.common.LoggableObject.LoggableObject
     Class/instance variable description: * Argument parser (argparse.ArgumentParser)
          __parser
        • Original default argument values (dict)
        • (filled by add_argument () method) _default_args
        • Parsed arguments (argparse.Namespace) ARGS
        • Stage config parser (ConfigParser.SafeConfigParser) __config

    Stage custom config (defaultdict(defaultdict(str))) CONFIG

     add_argument (*args, **kwargs)
          Add specific (not common) arguments.
     args_error (message)
          Output USAGE, error message and exit with code 2.
     config_error (message='Failed to read config file:')
          Output error message and exit with code 3.
     defaultArguments()
          Config argument parser with parameters common for all stages.
     log configuration()
          Log stage configuration.
     output_error (message=None, exc_info=None)
          Output traceback of the passed (or last) error with message.
     parse_args (args)
          Parse arguments and set dependant arguments if needed.
          Exits in case of error with code: 2 – failed to parse arguments 3 – failed to read config file
     print_usage (fd=<open file '<stderr>', mode 'w'>)
          Print usage message.
     read config()
```

1.2. Subpackages 23

Read stage custom config file.

```
Returns (TruelFalse)

reset_default_arguments (args=None)
Reset default argument values to the original ones.

Original default value is a value passed to the add_argument () method.

Parameters args (list, NoneType) - list of arguments to be reset. If not specified or set to None, all known arguments will be reset

run ()
Run the stage.

set_default_arguments (**kwargs)
Set (or overwrite) default values for arguments.

Parameters <arg_name> (object) - default value for argument <arg_name> set_error (err_type, err_val, err_trace)
Set object _err variable from the last error info.

stop ()
Stop running processes and output error information.
```

#### pyDKB.dataflow.stage.ProcessorStage module

Definition of an abstract class for Dataflow Data Processing Stages.

**USAGE:** ProcessorStage [<options>] [<input files>]

#### **OPTIONS:**

```
{flslh} - where to get data from: local (f)iles, (s)tdin, (h)dfs
-s, --source
                      DIR - base directory for relative input file names (for local and
-i, --input-dir
                      HDFS sources). If <input files> not specified, all files from the
                      directory will be taken as the input.
-d, --dest
                      {flslh} - where to send data to: local (f)iles, (s)tdout, (h)dfs
                      DIR - base directory for output files (for local and HDFS
-o, --output-dir
                      sources)
--hdfs
                        • equivalent to "-source h -dest h"
-m, --mode
                      MODE - MODE: (f)ile = -source f
                           -dest f (can be
                             rewritten with 's' or 'h')
                      (s)tream = -source s (can be
                             rewritten with 'h')
                           -dest s
                      (m)apreduce = -source s (can be
                             rewritten with 'h')
                           -dest s
```

```
class pyDKB.dataflow.stage.ProcessorStage.ProcessorStage(description='DKB
                                                                              Dataflow data processing
                                                                              stage.')
     Bases: pyDKB.dataflow.stage.AbstractStage.AbstractStage
     Abstract class to implement Processor stages
     Processor stage – is a stage for data processing/transformation.
     Class/instance variable description:
        • communication.consumer.Consumer instance __input
        • Generator object for output file descriptor OR file descriptor (for (s)tream mode)
               __output
        • List of objects to be "stopped" __stoppable
     clear buffer()
          Drop buffered output messages.
     configure (args=None)
          Configure stage according to the config parameters.
          If $args specified, arguments will be parsed anew.
     defaultArguments()
          Default parser configuration.
     flush_buffer()
          Flush message buffer to the output.
     forward()
          Send EOPMarker to the output stream.
     get_source_info()
          Get information about current source.
     input()
          Generator for input messages.
          Returns iterable object. Every iteration returns single input message to be processed.
     input_message_class()
          Get input message class.
     output (message)
          Put the (list of) message(s) to the output buffer.
     output_message_class()
          Get output message class.
     static process(stage, input_message)
          Transform input_message -> output_message.
          To be implemented individually for every stage. Takes the stage as first argument to allow calling output()
               from inside the function.
          Return value: True – processing successfully finished False – processing failed (skip the input message)
     run()
          Run process() for every input() message.
```

```
set_default_arguments (ignore_on_skip=False, **kwargs)
```

Set (or overwrite) default values for arguments.

#### **Parameters**

- ignore\_on\_skip (bool) ignore new default value when the stage is to be skipped
- <arg\_name> (object) default value for argument <arg\_name>

```
set_input_message_type (Type=None)
```

Set input message type.

```
set_output_message_type (Type=None)
```

Set output message class.

```
static skip_process(stage, input_message)
```

Process input\_message in "skip" processing mode.

Skip mode is turned on with command line parameter *-skip*; in this mode stage is expected to skip its "semantic" part of the message transformation (like changes in data fields format, definition of additional data fields, etc.) but perform actions required to keep the dataflow seamless.

The simpliest way to achieve this is to send the input message to the output without changes (marking it as "incomplete"), and this is the default implementation of the method.

In some cases it may be necessary to re-implement it (just like *process()*) to keep the dataflow unbroken.

NOTE: the output messages in "skip" mode MUST be marked as "incomplete".

```
Parameters input_message (pyDKB.messages.AbstractMessage) - message to process
```

**Returns** True/False (success/failure)

Return type bool

stop()

Finalize all the processes and prepare to exit.

#### **Submodules**

## pyDKB.dataflow.cds module

Extended CDSInvenioConnector allowing us to login via Kerberos

## pyDKB.dataflow.dkbID module

Utils to generate unique yet meaningful identifier for DKB objects.

```
pyDKB.dataflow.dkbID.dkbID (json_data, data_type)
```

Return unique identifier for object of TYPE based on DATA.

## pyDKB.dataflow.exceptions module

Definition of DKB Dataflow exceptions

**exception** pyDKB.dataflow.exceptions.DataflowException(message=", reason=None)

Bases: exceptions.Exception

Base Exception for Dataflow modules.

reason = None

## pyDKB.dataflow.types module

Type definitions for library objects.

**CHAPTER** 

**TWO** 

## **STAGES**

## 2.1 Stage 055

Stage for converting JSON documents (output of stage 015) into TTL documents (input for stage 060). Initial JSON document should have the following structure:

Some functions accept specific parts of this JSON - for example, if 'data' variable contains the initial JSON then "'CDS' part of the initial JSON" means "data.get('CDS')".

Resulting TTL file has the following structure:

```
PAPER a atlas: Paper .
PAPER atlas:hasGLANCE_ID ___ .

```

#### **TODO:** This module doesn't convert authors metadata. This task is still under consideration.

055\_documents2TTL.documents2ttl.abstract\_extraction(data) Extract abstract from JSON.

Parameters data (dict) - 'CDS' part of the initial JSON

**Returns** abstract or None if it was not found

**Return type** str or NoneType

055\_documents2TTL.documents2ttl.arxiv\_extraction(data) Extract arXiv code from JSON.

Parameters data (dict) - 'CDS' part of the initial JSON

Returns arXiv code or None if it was not found

**Return type** str or NoneType

055\_documents2TTL.documents2ttl.cds\_id\_extraction(data) Extract CDS id from JSON.

Parameters data (dict) - 'CDS' part of the initial JSON

Returns CDS id or None if it was not found

**Return type** int or NoneType

055\_documents2tTL.documents2ttl.cds\_internal\_extraction(data) Extract CDS internal report number parameter from JSON.

Parameters data (dict) - 'CDS' part of the initial JSON

Returns CDS internal report number or None if it was not found

Return type unicode or NoneType

055\_documents2ttl.documents2ttl.cds\_parameter\_extraction(param\_name, json\_data) Extract CDS parameter value from JSON.

#### Parameters

- param\_name (str) name of the parameter, defined in \*\_CDS\_ATTRS dict
- json\_data (dict) 'CDS' part of the initial JSON

**Returns** parameter value or None if it was not found

**Return type** int, str, NoneType

30 Chapter 2. Stages

 ${\tt 055\_documents2TTL.documents2ttl.creation\_date\_extraction} \ ({\it data})$ 

Extract creation date from JSON.

Parameters data (dict) - 'CDS' part of the initial JSON

Returns creation date or None if it was not found

**Return type** str or NoneType

055\_documents2TTL.documents2ttl.define\_globals(args)

Define global variables for further usage in other functions.

Global variables GRAPH and ONTOLOGY are defined, their values are received from the command line arguments via argparse.

Parameters args (argparse. Namespace) - stage arguments

055\_documents2TTL.documents2ttl.document\_cds(data, doc\_iri, cds\_attrs)

Convert CDS metadata from JSON to TTL.

#### **Parameters**

- data (dict) 'CDS' part of the initial JSON
- doc iri (str) document IRI for current graph
- cds\_attrs(list)-PAPER\_CDS\_ATTRS|NOTE\_CDS\_ATTRS

Returns TTL string with CDS metadata

Return type str

055\_documents2TTL.documents2ttl.document\_glance (data, doc\_iri, glance\_attrs) Convert GLANCE metadata from JSON to TTL.

#### **Parameters**

- data (dict) 'GLANCE' part of the initial JSON
- doc\_iri (str) document IRI for current graph
- glance\_attrs(list)-PAPER\_GLANCE\_ATTRS|NOTE\_GLANCE\_ATTRS

**Returns** TTL string with GLANCE metadata

Return type str

055 documents2TTL.documents2ttl.document links(data)

Construct TTL sentences to link paper to its supporting documents.

The result looks as following:

PAPER atlas:isBasedOn SUPPORTING DOCUMENT

Parameters data (dict) - initial JSON

Returns TTL string with links

Return type str

055\_documents2TTL.documents2ttl.doi2ttl(doi,doc\_iri)

Convert DOI parameter from JSON to TTL.

### **Parameters**

- doi(str, unicode or list) 'doi' part of the initial JSON
- doc iri (str) document IRI for current graph

2.1. Stage 055 31

```
Returns TTL string with DOI
          Return type str
055_documents2TTL.documents2ttl.fix_list_values(list_vals)
     Apply fix_string to each item in a list.
          Parameters list vals (list) – list with strings to be fixed
          Returns list with fixed strings
          Return type list
055_documents2TTL.documents2ttl.fix_string(wrong_string)
     Fix escape sequences in a string.
          Parameters wrong_string (object) – string to be fixed, or any non-string object.
          Returns fixed string, or unchanged non-string object
          Return type object
055 documents2TTL.documents2ttl.generate_journal_id(journal_dict)
     Generate a journal issue ID based on title, volume and year.
          Parameters journal_dict (dict) – journal parameters
          Returns journal ID
          Return type str
055_documents2TTL.documents2ttl.get_document_iri(doc_id)
     Construct an IRI for a document.
          Parameters doc_id (str) - document id
          Returns IRI
          Return type str
055_documents2TTL.documents2ttl.glance_parameter_extraction(param_name,
                                                                            json_data)
     Extract a GLANCE parameter value from JSON.
          Parameters
               • param_name (str) - name of the parameter
               • json data (dict) - 'GLANCE' part of the initial JSON
          Returns parameter value or None if it was not found
          Return type str, unicode, NoneType
055 documents2TTL.documents2tt1.keywords2tt1 (keywords, doc iri)
     Convert keywords from JSON to TTL.
          Parameters
               • keywords (dict or list of dicts) - 'keywords' part of the initial JSON
               • doc_iri (str) - document IRI for current graph
          Returns TTL string with keywords
          Return type str
055_documents2TTL.documents2ttl.main(argv)
     Parse command line arguments and run the stage.
```

32 Chapter 2. Stages

#### **Parameters argv** (list) – arguments

055\_documents2TTL.documents2ttl.process(stage, msg)

Transform input JSON message into TTL documents.

Implementation of *ProcessorStage.process()* for hooking the stage into DKB workflow. Output message containing the TTL result is generated in this function.

### **Parameters**

- **stage** (pyDKB.dataflow.stage.ProcessorStage) **stage** instance
- msg (pyDKB.dataflow.communication.messages.JSONMessage) input message with initial JSON

Returns True

Return type bool

055\_documents2TTL.documents2ttl.process\_journals(data, doc\_iri) Convert journal data from JSON to TTL.

#### **Parameters**

- data (list, dict) 'CDS' part of the initial JSON
- doc\_iri (str) document IRI for current graph

**Returns** TTL string with journal issue with connection to paper

Return type str

055\_documents2TTL.documents2ttl.report\_number\_extraction(data) Extract report number from JSON.

Parameters data (dict) - 'CDS' part of the initial JSON

Returns report number or None if it was not found

Return type unicode or NoneType

055\_documents2TTL.documents2ttl.title\_extraction(data) Extracting title from JSON.

**Parameters data** (dict) - 'CDS' part of the initial JSON

Returns title or None if it was not found

Return type str or NoneType
